```
protein, designated MOAT-C. The protein comprises a multi-domain structure including a tandem repeat of nucleotide binding folds appended C-terminal to a hydrophobic domain, having Walker A and B ATP binding sites and several potential membrane spanning domains. The MOAT nucleic acids are useful for screening a test compound for inhibition of MOAT mediated transport, indicated by restoration of anticancer drug sensitivity, which in turn causes a reduction of transporter mediated cellular efflux of anticancer agents. MOAT DNA or RNA may be used as probes to detect the presence or expression of genes encoding MOAT proteins. Anti-MOAT antibodies are useful for detecting and quantitating
                                                                                                                                                                                               present sequence encodes a human MPR-related

                                                                                                                                                                                                                                                                                                            The present sequence is that of human ATP binding cassette subfamily C protein ABCC5 CDNA. The CDNA was identified using a differential display method in which monocytes from peripheral blood were subjected to macrophage differentiation and cholesterol blood were subjected to macrophage differentiation and cholesterol coading with high density lipoproteins and subsequent cholesterol sensitive genes. The gene maps to chromosome 3q25-27 and is also termed MRP5 (multidrug resistance associated protein). This is the gene locus for bubin-Johnson syndrome, a disorder associated with mild chronic conjugated hyperbilitubinemia. The invention provides cholesterol-sensitive ABC genes (see AA29134-63). These genes, and polypeptides encoded by them.

CRAPA134-63). These genes, and polypeptides encoded by them.

CRAPA134-63). These genes, and polypeptides encoded by them.

CRAPA134-63. These genes, and polypeptides encoded by them for a bubin and polypeptides chooses and and polyperic applications, and for call-based assays to screen for pharmacologically disorders, atherosclerosis or other inflammatory diseases such as poriasis and lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120

Inhibitors of (I) are useful for improving the effectiveness of a chemotherapeutic regimen to eradicate multidrug-resistant transformed cells, especially cancer cells, from the body of a mammal, preferably human. (I) is also useful for drug discovery, especially to the design of novel chemotherapeutic drugs that are cytotoxic to cells expressing (I). This sequence encodes the human MRP-beta protein which is described in the

of a multidurg-resistance phenotype in transformed mammalian cells, including carcinoma and adenocarcinoma cells. A unique fragment cee AAV65683) of the MRP-beta gene was identified by computer assisted searching of a nucleic acid database corresponding to a human endothelial cell (HUMVEC) expression library. It was used the search the HUMVEC expression library. This yielded a 4.78 kb clone, designated fohd013a05m (deposited as ATCC 98409). Two independent cDNA clones comprising approximately 60 residues upstream from fohd013a05m were isolated by hybridisation screening of human brain and librar cDNA libraries using a probe from the 5' end of fohd01305m. The presented sequence of MRP-beta cDNA comprises fohd01305m and 6e additional upstream nucleotides. The invention provides compositions and methods for improving the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This nucleotide sequence codes for novel human multidrug resistance associated protein (MRP-beta, see AAW80597), over-expression of which is thought to be associated with the emergence and/or persistence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated multidrug resistance-associated polypeptide - used to develop products for modulating multidrug resistance, particularly for reducing resistance of tumours to chemotherapeutic drugs

effectiveness of chemotherapeutic regimens to eradicate multidrug-resistant transformed cells from the body of a mammal, especially a human. The disclosed compositions include MRP-beta nucleic acids, including probes and antisense oligonucleotides (see also AaV65684-88), MRP-beta polypeptides and antibodies, MRP-beta expressing host cells, and non-human mammals that are transgenic or nullizygous for MRP-beta. The disclosed methods include methods for attenuating aberrant MRP-beta gene expression, protein production and/or protein function, and for improving the effectiveness of chemotherapy for a mammal afflicted with a multidrug-resistant tumour, wherein the tumour is of mammary, respitatory tract, urogenital tract, endocrine system or immune system orighn. In addition, methods are disclosed for identifying and using a modulator, such as an inhibitor, that is cytotoxic to cells expressing MRP-beta. 8 \$ 9 9 9 9 9 9 9 9 9 9 9 9 8 8

This sequence encodes a multidrug resistance-associated polypeptide (MRP-beta). MRP-beta is a transporter that can remove chemotherapeutic agents from cells and/or sequester such agents, and it probably accounts for multidrug resistant phenotypes that do not respond to treatments with reversal agents directed against P-glycoprotein or the known MRP. By inactivating MRP-beta, at nucleic acid or protein levels, cells should be rendered sensitive to chemotherapy agents. The MRP-beta coding sequence, or fragments of it, can be used to detect expression of the MRP-beta gene and thus multidrug resistant cells. Fragments of MRP-beta DNA are useful as primers and as antisense (therapeutic) agents for inhibiting expression of the MRP-beta gene. They can also be used for detecting mutations and to treat diseases associated with abnormal MRP-beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  241 CATGCATTCTCAGCTCAGAATCCTGGATGAGGAGCATCCCAAGGGAAAGTACCATCATGG 300

These substrates are anotherwise comparations and anotherwise substrates are also transported by a novel canalicular multispecific organic anion transporter (cMOAT) protein. The ATP dependent comon transporter (cMOAT) protein. The ATP dependent comon anion transporter system mediates heptacobiliary excretion in the liver. cMOAT may be a liver-specific homologue of multidrug resistance-associated protein. The nucleic acids are used to provide cells with cMOAT protein activity, cMOAT protein activity in cells can be enhanced by increasing the level of glutathione, glucuronide and/or sulphate. Antisense constructs, especially derived from another multidrug resistance (MDR)-related protein, e.g. MDR-1, to the nucleic acids and vectors can be used to decrease the level of cMOAT in a cell. The nucleic acids and proteins can be used especially in diagnosis of Dubin-Johnson disease, Rotor disease or another disease involving cMOAT. The cMOAT gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present cDNA sequence encodes a human multidrug resistance-associated protein 5 (MRP5). The MRP5 gene has been localised to chromosome 3. The MRP5 protein is a member of the ATP-binding cassette (ABC) transporter family of anorganic anion transporters. MRP5 is a 4 domain protein, with 2 APP-binding domains, and 2 domains with transmembrane regions. The protein is a homologue of MRP1, which is involved in ATP-dependent transport of glutathione conjugates such as dinitrophenyl glutathione.

```
The present cDNA sequence encodes a human multidrug resistance-associated protein 5 (MRP5). The MRP5 gene has been localised to chromosome 3. The MRP5 protein is a member of the ATP-binding cassette (ABC) transporter family of anorganic anion transporters. MRP5 is a 4 domain protein, with comparing the anorganic anion transporters. MRP5 is a 4 domain protein, with comparing the protein is a homologue of MRP1, which is involved in ATP-dependent transport of glutathione conjugates such as dinitrophenyl glutathione. These substrates are also transported by a novel canalicular transporter comparing transporter system mediates hepatobilizary excretion in dependent cMOAT transporter system mediates hepatobilizary excretion in the liver. CMOAT may be a liver-specific homologue of multidrug resistance-associated protein. The nucleic acids are used to provide cells with cMOAT protein activity. cMOAT protein activity in cells can be enhanced by increasing the level of glutathione, glucuronide and/or sulphate. Antisense constructs, especially derived from another multidrug vectors can be used to decrease the level of cMOAT in diagnosis of Dubin-Johnson disease, Rotor disease or another disease involving cMOAT. The cMOAT gene compared as a selectable marker gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1979 CATTGCAATCAGTGGAACCTTCGCTTATGTGGCCCAGCAGGCCTGGATCCTCAATGCTAC 2038

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (first
```

The present sequence is a human transporter-related protein cDNA. The human transporter-related protein share structural similarity with mammalian metabolite or organic cation transporters, multi-drug resistance (MDR) proteins, mammalian sodium-glucose cotransporters and other cellular transporters. The transporter-related protein DNA may be used for the detection of mutant sequences or inappropriately expressed sequences for the diagnosis of disease. They may also be used to screen for drugs effective in the treatment of the symptomatic or phenotypic manifestations of perturbing the normal functions of the sequences of the invention in the body. They may also be used in gene therapy for treating biological conditions. Novel polynucleotides encoding novel human proteins with structural similarity to cellular transporters for the diagnosis of disease and Claim 4; Page 60-61; 91pp; English. WPI; 2001-514599/56. P-PSDB; AAE08075. in gene therapy

The NHP oligonucleotides can also be used as hybridization probes for screening libraries, for molecules. The NHP nucleotide sequences are also useful in screening techniques for drugs which treats symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. Sequences AAF83635-647 represent NHP nucleic acid sequences.
                                                                                                                                                                                                                                                                                                                                                     Novel isolated human polynucleotide sequences encoding polypeptides that share sequence similarity with mammalian multidrug resistance proteins and cellular transporter proteins, useful as probe or primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   526

CC mammalian metabolite or organic cation transporters, multi-drug
Cresistance (MDR) proteins, mammalian sodium-glucose cotransporters and
Cother cellular transporters. The transporter-related protein DNA may be
CC used for the detection of mutant sequences or inappropriately expressed
CC sequences for the diagnosis of disease. They may also be used to screen
CC for drugs effective in the treatment of the symptomatic or phenotypic
C manifestations of perturbing the normal functions of the sequences of the
CC invention in the body. They may also be used in gene therapy for treating
XX Sequence 3660 BP: 920 A: 915 C: 943 G: 881 T: 1 other.

XX Mammalian adenosine triphosphate-bi CDNA, useful for diagnosis and tree broast proliferative fibrocystic diax XX The invention relates to adenosine CC Sequences of the invention are useful breast adenocarcinoma and drug resi breast adenocarcinoma and drug resi breast adenocarcinoma and drug resi companion are useful are model systems for human breast companion are useful breast companion are useful are model systems for human breast therapy. ABCP sequences are useful B-lymphocyte immunosplobulin library CC specificity. They are also useful are breasent sequence is a cDNA encompanion.

Mammalian adenosine triphosphate-binding cassette protein, and encoding cDNA, useful for diagnosis and treatment of breast disorders, e.g. breast proliferative fibrocystic disease and breast adenocarcinoma - Claim 2; Fig 1; 80pp; English.

The invention relates to adenosine triphosphate (ATP)-binding cassette (ABC) proteins (ABCP) and nucleic acid molecules encoding such proteins

The invention relates to adenosine triphosphate (ATP)-binding cassette (ABC) proteins (ABC) proteins (ABC) proteins (ABC) proteins and uncleic acid molecules encoding such proteins. Sequences of the invention are useful for the diagnosis and treatment of breast disorders, particularly breast proliferative fibrocystic disease, breast adenocarcinoma and drug resistance. Polynucleotides of the invention are used to produce transgenic cell lines or organisms which are model systems for human breast disorders. They are also used in gene therapy. ABCP sequences are useful in screening assays of phagemid or brymphocyte immunoglobulin library to identify antibodies having desired specificity. They are also useful as chemoprotectants and as vaccines. The present sequence is a CDNA encoding human ABC protein.

Sequence 4074 BP; 961 A; 1050 C; 1080 G; 983 T; 0 other;

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate.

Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer -

WPI; 2001-662795/76.

Claim 1; Page 3467; 11750pp; English.

(e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound;

(d) assessing the efficacy of a therapy in a patient;

cancer in a patient;

for inhibiting prostate cancer

prostate cells and correlating with presence of prostate cancer.

Ye createcting presence of prostate cancer. stage of prostate cancer.

Ye claim 1; Page 5435-5436; 11750pp; English.

Xi create cancer in the invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for:

(a) assessing whether a patient is afflicted with prostate cancer;

(b) monitoring the progression of prostate cancer in a patient;

(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;

(d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient;

(e) salecting a composition for inhibiting prostate cancer in a patient;

(f) assessing the prostate cell carcinogenic potential of a compound;

(g) determining whether prostate cancer has metastasized in a patient;

(h) assessing the aggressiveness or indolence of prostate cancer in a patient;

(g) determining whether prostate cancer has metastasized in a patient;

(g) determining as a pharmacodyanamic or pharmacogenomic marker.
